

# BIOL 428 Nutrigenomics

New course Spring 2017

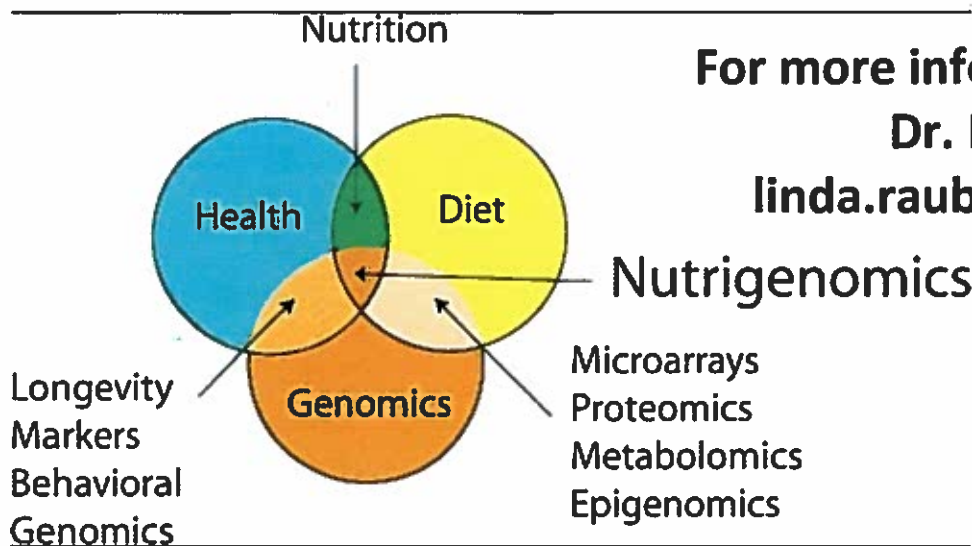

MWF 11-11:50am, Tu 6-8:50pm

Why is a high fat diet good for one person, but another does well on low fat and high carbs?

Why does one person eat tons of food but stays slender, but the next watches what they eat and gains weight?

To answer these questions, and many others, we need to address the interaction between our genes and our diet (plus some epigenetics and information about our gut microbes).
